

Lab 14 Solutions

1. Show that TSP is NP-complete. (Hint: use the relationship between TSP and HamiltonianCycle discussed in the slides. You may assume that the HamiltonianCycle problem is NP-complete.)

Solution:

First show TSP is in NP.

Suppose R is an NP problem. We must show that $R \xrightarrow{\text{poly}}$ TSP. Notice that

$$R \xrightarrow{\text{poly}} \text{HC} \xrightarrow{\text{poly}} \text{TSP}$$

The first is because HC is NP-complete; the second is shown in the lecture.

So $R \xrightarrow{\text{poly}}$ TSP.

2. Below is another variation of the Knapsack problem.

Given a set $S = \{s_0, s_1, \dots, s_{n-1}\}$ of items, weights $\{w_0, w_1, \dots, w_{n-1}\}$, values $\{v_0, v_1, \dots, v_{n-1}\}$, a max weight W , and a min value V , find a subset T of S whose total value is no less than V and total weight is at most W .

Show that the SubsetSum problem is polynomial reducible to this Knapsack problem.

Solution:

Let SS be a SubsetSum instance of size n consisting of the set $S = \{s_0, s_1, \dots, s_{n-1}\}$ of positive integers and a non-negative integer k . We show how to transform S into a Knapsack instance KN in polynomial time. We must provide a set of items with weights and values, and maximum weight W and minimum value V .

We define KN as follows: Let the set S from SS be the KN set of items. For each i , let $w_i = s_i$ and let $v_i = s_i$. Let $W = k$ and let $V = k$. These definitions specify a Knapsack instance of size $O(n)$. We must show that a solution to SS yields a solution to KN, and conversely.

Verification: Solution to SS \Rightarrow Solution to KN

Suppose T is a solution to SS (T is a subset of S whose sum is k). We show T is also a solution to KN. We must show

$$\sum_{s_i \in T} w_i \leq W \text{ and } \sum_{s_i \in T} v_i \geq V.$$

Since T is a solution to SS, we know

$$\sum_{s_i \in T} s_i = k.$$

It follows that

$$\sum_{s_i \in T} w_i = \sum_{s_i \in T} s_i = k = W$$

and

$$\sum_{s_i \in T} v_i = \sum_{s_i \in T} s_i = k = V$$

as required. We have shown that a solution to SS yields a solution to KN.

Verification: Solution to KN \Rightarrow Solution to SS

Suppose T is a solution to KN (T is a subset of S the sum of whose weights is $\leq W$ and sum of whose values is $\geq V$). We show T is also a solution to SS. We must show that

$$\sum_{s_i \in T} s_i = k.$$

Since T is a solution to KN we have

$$\sum_{s_i \in T} s_i = \sum_{s_i \in T} w_i \leq W = k$$

and also

$$\sum_{s_i \in T} s_i = \sum_{s_i \in T} v_i \geq V = k$$

which, together, establish the desired result. We have shown that a solution to KN yields a solution to SS.

3. Show that the worst case for VertexCoverApprox can happen by giving an example of a graph G which has these properties:
 - a. G has a smallest vertex cover of size s
 - b. VertexCoverApprox outputs size $2*s$ as its approximation to optimal size.

Solution:

Consider the following disconnected graph with 2 edges and 4 vertices:

$$\begin{array}{l} A - B \\ C - D \end{array}$$

The smallest vertex cover has size 2 – an example of such a vertex cover is {A, C}. However, the output of the VertexCoverApprox algorithm is {A, B, C, D}, a cover that has exactly twice the size of a minimal cover.

4. Show that the VertexCover decision problem belongs to NP.

Solution. Assume a solution U of vertices is given as a solution to the VertexCover problem with input $G = (V, E)$, k . To verify that U is correct, we must

- (1) Show that $U \subseteq V$
- (2) Show that U is a vertex cover – verify that each edge in E has an endpoint in U
- (3) Show that $|U| \leq k$

(1) requires $O(n)$ (using hashtable for storing sets); (2) requires $O(m)$ (where m is the number of edges). And (3) is (under reasonable assumptions) $O(1)$. Therefore time to check correctness is $O(n^2)$ and hence VertexCover is in NP.
